We.PLM internship submission

SmartHireAI

Project requirements.
Consultant evidence.
A shortlist a reviewer can explain.

Varad · 11 November 2026
Python / Django / PostgreSQL
All demonstration data is synthetic.

The company brief

Six modules, with a visible end-to-end path.

Module	What the evaluator can try
User authentication	Role homes and organisation access
Candidate management	Invitation, profile, skills and PDF upload
Project requirements	Weighted skills and approved rubric versions
Skill matching	Aliases, visible evidence and reviewer decisions
Candidate ranking	Review groups, ties and reproducible results
Dashboard and reports	Bench utilisation and filtered CSV/XLSX

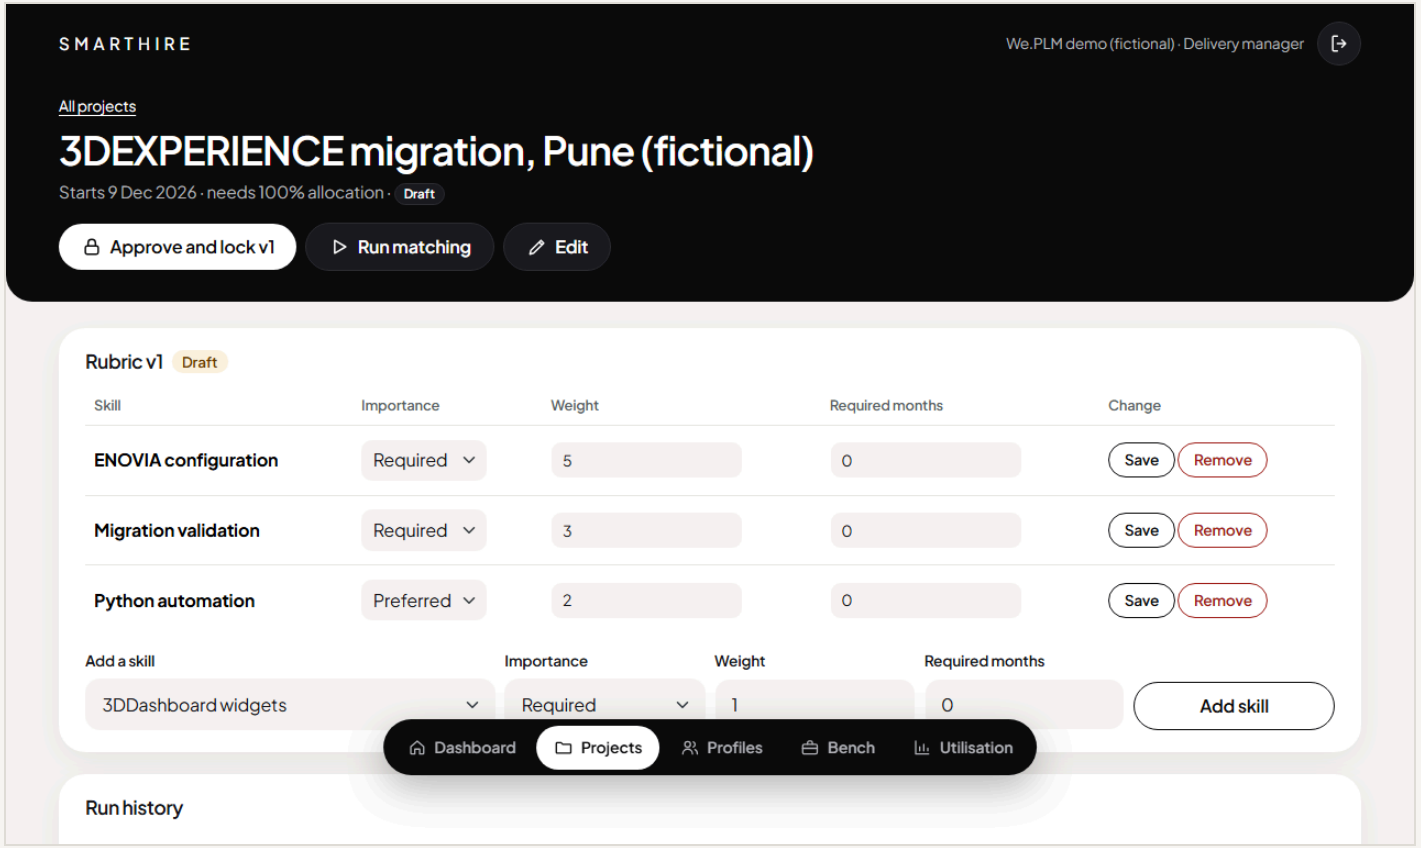

A PLM staffing decision

One requirement compares internal consultants and external applicants.

3DEXPERIENCE migration

- ENOVIA configuration: required, weight 5
- Migration validation: required, weight 3
- Python automation: preferred, weight 2

A manager approves the rubric before matching.

Recorded synthetic project and rubric, 9 November

Coverage and Staffing fit

Merit and availability remain separate, so the reason behind a rank stays clear.

Coverage

Weighted criteria supported by accepted evidence, adjusted for required duration.

Staffing fit

Capacity and start-date fit, using the stored run date.

Worked example	Credited weight / 10	Coverage
A: ENOVIA + self-reported migration	6.5	65.00
B: ENOVIA + Python	7.0	70.00
B: accepted visible migration evidence added	10.0	100.00

Coverage describes this project's criteria. It is not a probability of hiring success.

The evidence path

The scorer receives structured records.

1. **Upload and quarantine**
   Private PDF storage, bounded input, scanner child process
2. **Visible-text extraction**
   Hidden spans stay excluded and available for staff review
3. **Provisional skill suggestions**
   spaCy phrase rules and controlled aliases
4. **Evidence eligibility**
   Reviewer-accepted visible passage, or a candidate-confirmed form claim
5. **One scoring function**
   Approved rubric, accepted evidence and versioned run inputs

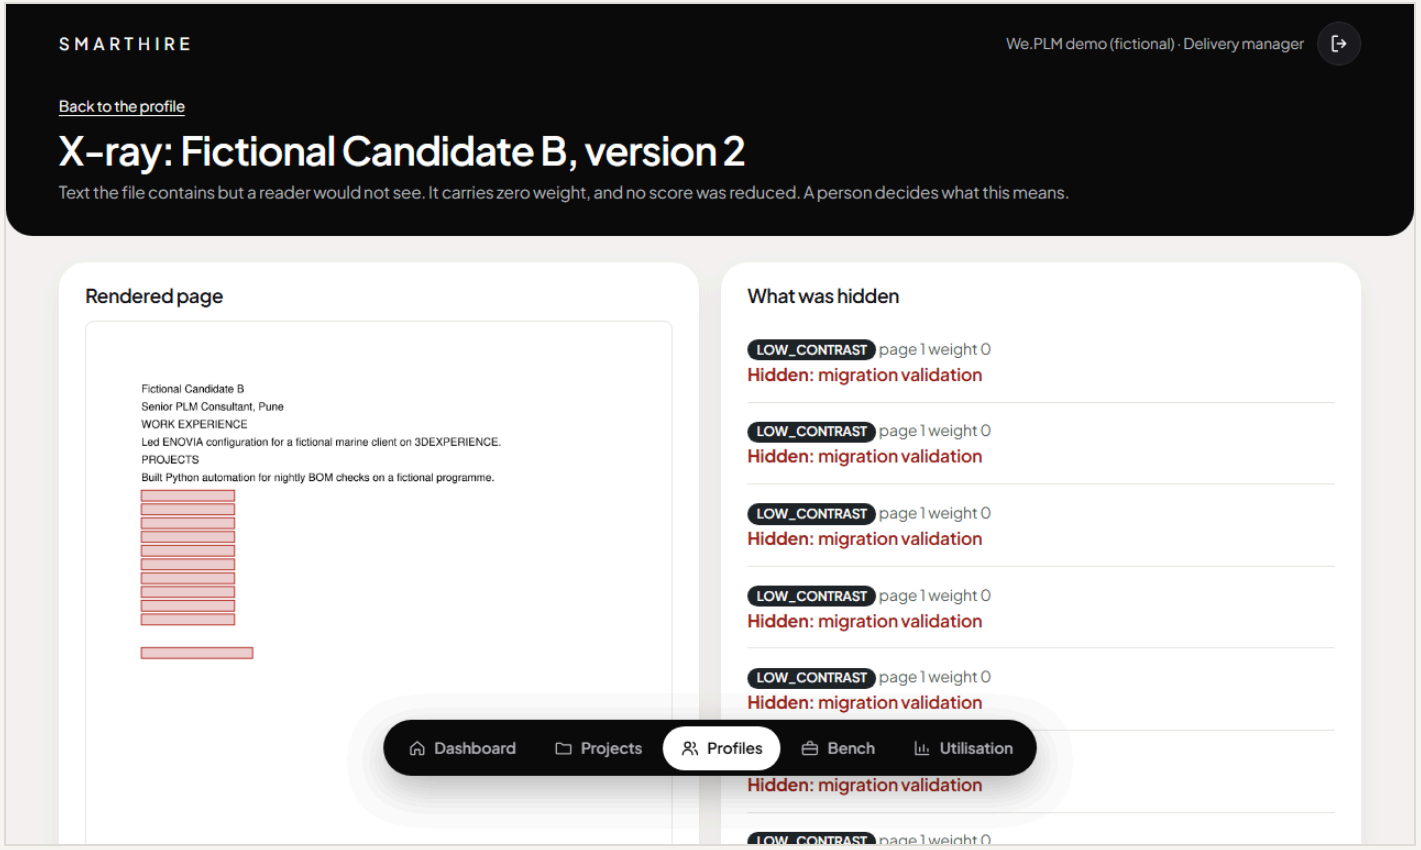

The attacked resume

Hidden migration keywords add no credit. Candidate B stays at 70.00.

The X-ray exposes the excluded text.

A reviewer can inspect the file without treating a flag as proof of cheating.

Visible false claims still require an interview or skills test.

Recorded X-ray excerpt of a synthetic attack, 9 November

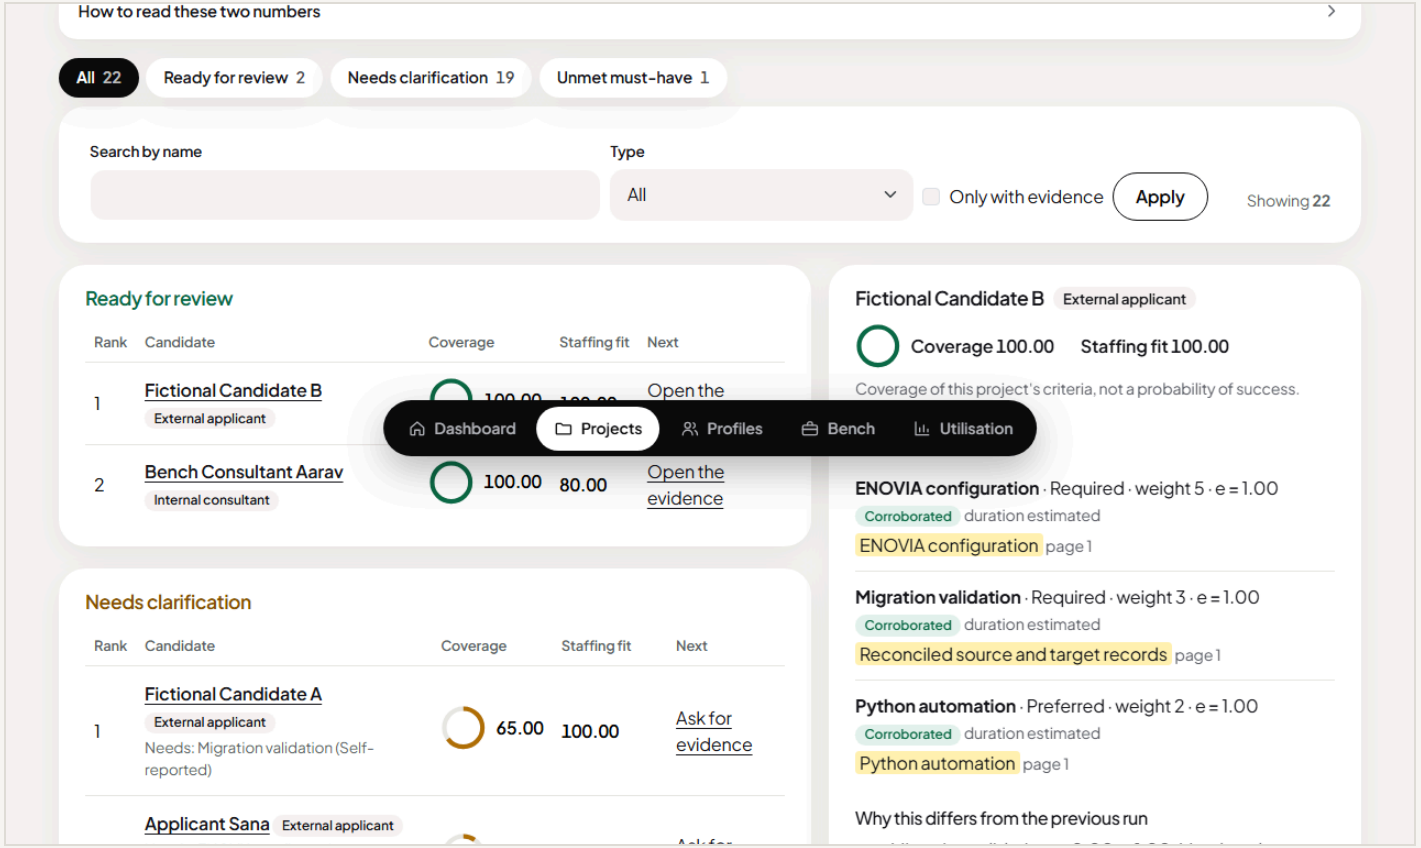

Correction and history

A reviewer accepts new visible evidence. A new run changes the score.

70.00 then 100.00

The corrected migration passage supplies the missing required evidence.

The old run preserves its score and inputs. Screen, API and export use stored results.

Recorded corrected shortlist excerpt, 9 November

Verification evidence

Recorded baseline: 9 November 2026, Windows, Python 3.12.6, PostgreSQL 16.14.

Check	Recorded result
Full non-browser suite	878 passed, coverage 95%
Attack twin comparisons	0 promotions across 18 pairs, 2 review policies
Benign scanner examples	0 flags across 9 documents
Isolation suite	394 passed
Browser suite	2 passed

These results cover named fixtures. They are not a universal guarantee. Current submission checks are recorded separately.

Repository handover

Each company deliverable has an entry point.

Deliverable	Entry point
Source code	README setup, apps/, config/, templates/, static/
Database schema	docs/architecture/er.md and migrations
API documentation	/api/docs/ and docs/contracts/openapi.yaml
Test cases	App tests, tests/ and test register
User manual	Candidate and recruiter guides
Final presentation	This PDF, offline deck and five-minute script

Limits and next validation

Current limits

- Controlled phrase matching, with no trained model or LLM
- PDF only, with manual skill entry as fallback
- Invitation issuance has no staff UI
- No interview scheduler or email notifications
- No real-project suitability or time-saved study

Next validation

A mentor labels skills and shortlist suitability for a held-out set.

A project lead compares manual staffing with the prototype in a timed shadow review.

Measure precision, recall, Precision@3, missed suitable people and reviewer time before broader use.
